                              This DNA sequence encodes the P45 component (see AAW72847) of the pulymerase enhancing factor (PEF) of Pyrococcus furiosus DSM 3638.

C PCR primers (see AAA668861-64) based on an N-terminal peptide (see CR PCR primers (see AAA668861-64) based on an N-terminal peptide (see CR PCR primers (see AAA668861-64) based on an N-terminal peptide (see CR PCR products and plasmid sequencing was carried out on purified PCR products and plasmid min-preps. P45 and P40 (see AAW72844) are the predominant components of PEF, which acts to enhance the activity of P. furiosus DNA preparase, thereby providing replication products of greater length and purity. P45 was identified as a dUTPase, and possesses polymerase enhancing activity. The invention provides novel activity of nucleic acid polymerases, as well as DNA constructs and activity for purifying and using these contribodies. Also included are methods for identifying compositions with polymerase enhancing activity, for purifying and using these compositions and pecific extracts, proteins and compositions and pecific extracts, proteins and composition composition are provided for replicating nucleic remanding activity. Risk are provided for replicating nucleic enhancing activity. Risk are provided for replicating nucleic enhancing activity. Risk are provided for replicating nucleic acid sequencing or amplification (preferably PCR or RT-PCR). Isolated DNA can be used in the recombinant production of P45.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FW) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GTTATTGGTTCTTTTGCTTGGGTTGACCCAGGATGGGAAACTTAACACTAATGCTC 318

 present invention relates to a composition comprising two nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            79 TATGACCTCAGAGTGGGCAGAGAGGCTTTTGTTAAGGGGAAATTAATCGACGTGGAAAAG 138
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    139 GAAGGAAAAGTCGTTATTCCTCCAAGGGAATACGCCTTAATCCTAACCCTCGAGAGGATA 198
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAAATCAGAAAAGAAATACTTATAGAGCCATTTTCTGAAGAATCGCTCCAACCAGCAGGT 78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 936;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a shorte surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TATGACCTCAGAGTGGGCAGAGAGGCTTTTGTTAAGGGGAAATTAATCGACGTGGAAAAG 138

                                                                                                                                                    379 TITATAAGGCTAGAGGGTCCGGCAAGAAACCCTTACAGAGGAAACTATCAGGGGAGCACA 438
                                                                                                                                                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms; e.g. for genotyping, monitoring gene expression

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                group, useful as labels i

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genetyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           79 TATGACCTCAGAGTGGGCAGAGGCTTTTGTTAAGGGGAAATTAATCGACGTGGAAAAG 138

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
```

```
The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FFM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         79 TATGACCTCAGAGTGGGCAGAGAGGCTTTTGTTAAGGGGAAATTAATCGACGTGGAAAAG 138

                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

         group, useful as labels in allowing repeat analyses on
                                                              The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   79 TATGACCTCAGAGTGGGCAGAGGCTTTTGTTAAGGGGAAATTAATCGACGTGGAAAAG 138

The present sequence encodes a Helicobacter pylori antigenic protein that is characterised by immunoreactivity with H. pylori-positive antisera. The proteins are highly immunogenic and induce a long-lasting immune response that persists even after antimicriobial treatment. In antibody-detection assays, on sera, plasma, urine, saliva etc., they are highly sensitive and specific. The specification also describes 69 previously unrecognised immunogenic cluster families. H. pylori antigens are used to detect H. pylori-specific antibodies, for diagnosing infection or to confirm eradication of infection, and in vaccines to protect against H. pylori infection and related diseases (gastritis, peptic ulcer, gastric adenocarcinoma/lymphoma).
                                                                                                                                                                                                                                                                                                                                                                                       New Helicobacter pylori antigens and related nucleic acid sequences - useful in serological diagnosis and protective vaccines, providing long-lasting immune response

Nomura, N. and Sako, Y. are at Kyoto University, Sakyo-ku, Kyoto 606-8502, Japan
The other authors are at the National Institute of Technology and Evaluation, 2-49-10 Nishihara, Shibuya, Tokyo 151-0066, Japan.
All the sequence with length 100 codons or more between ATG or GTG and stop codon are defined as CDS codons or more between ATG or GTG and stop codon are defined by Smith-Waterman algorithm against GenBank and GenPept release 109; EMBL release 56.0; SwissProt release 36.0; PIR-Protein release 57.0; and OWL release 31.0.

Funding for cattle EST sequencing was provided by the USDA National

Research Initiative, Animal Genome Resource Grant AG 99-3205-8534

for A. Lewin and J. E. Womack, Base Calling/Quality Scores: PHRED

from Washington University Genome Center. Vector Trimmi g:

Cross_match from Washington University Genome Center PHRAP suite.

This sequence is vector free and at least 200 bp in length.
                                                                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Cetartiodactyla; Ruminantia; Pecora; Bovoldea; Bovidae; Bos.

polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C2p
library is a subtracted library derived from the UI-R-C1
library, which is a subtracted library derived from the UI-R-C0 library.

UI-R-C0 library. The UI-R-C0 library consisted of a
mixture of individually tagged normalized libraries
constructed from rat placenta, audit lung, brain, liver,
kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day
embryo. The tag is a string of 3-5 norlectides present
between the Not I site and the oligo-dT track which allows
identification of the library of origin of a clone within
the mixture. The subtracted library of origin of a clone within
the mixture as follows: PCR amplified CDNA inserts from
UI-R-C1 clones from which 3' ESTS had been derived was
used as a driver in a hybridization with the UI-R-C1
library in the form of single-stranded circles. The
remaining single-stranded circles (subtracted library) was
purified by hydroxyapatite column chromatography,
converted to double-stranded circles and electroporated
into DH10B bacterial (Life Technologies) to generate the
UI-R-C2p library. This procedure has been previously
described (Bonaldo, Lennon and Soares, Genome Research 6:
791-806, 1996)"
